# ZOOM Nitro® Timer

## Measure Real-Time Thru-Put. Maximize Results.

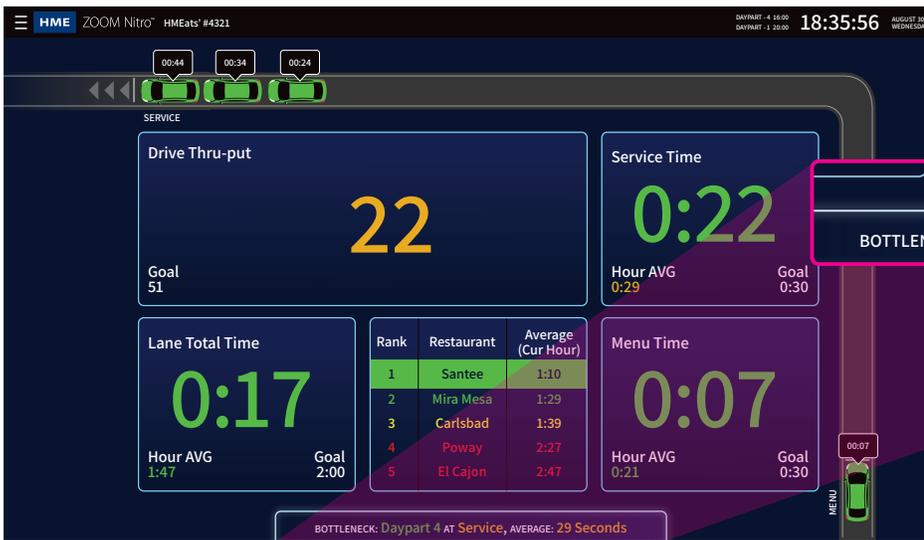

Provide your team with a target number of cars to serve within the hour.

## A Calculated Approach for Serving More Cars

The ZOOM Nitro Timer measures your drive-thru capacity in real time by calculating your speed, past performance, and current bottlenecks. At the top of every hour, the calculation resets and reacts to any present bottlenecks affecting your service times, resulting in the most up-to-date estimates at all times of the day. Drive Thru-put keeps teams engaged in their restaurant's capacity and motivates them to serve a target number of customers every hour.

**BOTTLENECK: Daypart 4 AT Service, AVERAGE: 29 Seconds**

## Critical Information at a Glance

ZOOM Nitro Timer makes it easier than ever for store managers to stay on top of their drive-thru performance. The bottleneck ticker provides key information at a glance in a color-coded snapshot, helping managers make quick and informed decisions to increase Drive Thru-put

and improve the customer experience. Bottleneck information is automatically recalculated with each transaction, freeing managers to stay focused on coaching the crew and running your operation.

## Customized to Reflect Your Store's Needs

Unlike other drive-thru timers, the ZOOM Nitro Timer enables you to configure Drive Thru-put measurements based on your preferred lane events. Nobody knows your store better than you do, so choose the detection points that matter most. Include or exclude any combination of your configured lane events, including Pre-Menu, providing you with greater control over your store's drive-thru performance.

Take your operation to the next level.
