

## ZOOM v3.11

October 2018

There are some exciting new enhancements available with ZOOM v3.11!

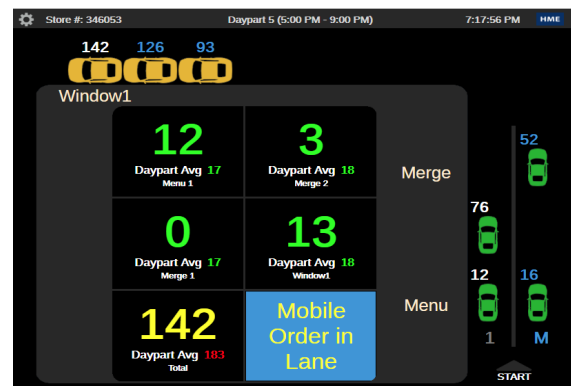

### Integration of HME Wireless Detectors into CU50

The all-new HME wireless detectors simplify the installation and tracking of remote detection points, such as drive-thru pull forward, mobile order pick-up, and curbside delivery with the CU50 v3.11. It enables customers to locate the car in the designated parking spot and track the speed of service metrics (e.g., Total wait time) on the CU50 dashboard.

### Support for Mobile Order Lane

Applies to Y-lane configuration stores, where the inner lane is the Menu Order lane and the outer lane is the dedicated Mobile Order lane. Mobile Order lane allows customers to skip the Menu portion of the lane and any queue for the Menu, giving them a benefit to ordering through the mobile app. This feature enables restaurant crew to identify a Mobile order car on the ZOOM dashboard versus a Menu order car. Mobile order cars are detected at the entry to the Mobile lane and display the word "Mobile Order in Lane" on the ZOOM dashboard. The timing info is shown in blue to differentiate the Mobile Order cars.

### POS Integration with CU50

HME ZOOM timers (CU50) are integrated with both the Radiant POS and Oracle POS system. The POS order information (e.g., order number, transaction amount, etc.) flows from POS terminal to the HME ZOOM timer and is properly displayed on the ZOOM dashboard. Call your local HME sales representative to discuss your specific POS version and need.
